

1. The Countdown Begins (Champion)

- `Timer` → constructor sets `this.timer = 20` (the Owner variable).
- `Countdown` → `setInterval(..., 1000)` calls `countdownTick()`: decrements timer, and if `timer < 1`, restarts (see "Starting Over" below).
- `Labels` → `drawLabels()` renders `Time left: & timer` every frame ("RUNS ALWAYS").

2. The Challengers Emerge (Challenger)

- `Direction` (custom function) → `direction()`: picks `spinSpeed` (-500..500) and `speed` (100..400), then schedules itself again after a random 0–4s via `setTimeout`, mirroring "Do actions after some time."
- `Start` → the constructor calls `this.direction()` once on creation.

3. Not that easy! (Border AI)

- `boarderAI()` checks proximity (<60px) to each edge and sets a push vector (`borderPushX/Y`) away from that edge, added into the movement each frame — same branching structure as your `if / else if` block (x too low → push right, x too high → push left, same for y).

4. That's a knockout! (Defeat)

- `defeatCheck()`: if `x < 0 || x > width` → `score += 1`, remove; else if same check on y. `score` lives on the shared `game` object, acting as your game variable.

5. How many so far? / Onto the round

- `Labels` also prints `Score: & score`.
- `Win` → `checkWin()`: if (`challengers.length < 1`) `goToScene(next)` — same as count items in list < 1.

6. A New Level

- `LEVELS = {1: {...}, 2: {...}}` plus `goToScene()` — Level 2 spawns more challengers (9 vs 4) for the harder round.

7. Starting Over

- Inside `countdownTick()`, when `timer < 1`: `game.score = 0; goToScene(1)` — reset and drop back to Level 1.

8. High Score

- `game.highscore` is the game variable; in `drawLabels()`, if (`score > highscore`) `highscore = score`, then it's displayed alongside the other labels — matching the "Champion - High Score" and "Champion - Labels" actors in your notes.
